Description Specification

The Oxfam Tank is supplied as a two part kit, the steel sheets and the liner and accessories.

First used in the field in the 1970s the Oxfam Tank has been a constant and reliable part of emergency water treatment and distributions systems in every response since. When erected carefully and maintained these tanks can remain in service for decades.

- Corrugated steel sheets to make a round, rigid, water tank 6.4m Ø 3.0 m high
- Liner (with repair kit), all accessories and fittings.

Note: Bolts, nuts and washers for tank assembly are included in the Liner kit. (These can be ordered separately.)

User notes

- A roof is required when storing treated water. The Tank Roof kit, Steel is recommended of all installations, especially where longevity is required as it will endure more extreme weather conditions and requires little maintenance. Select the Tank Roof kit, PVC for speed and low cost.
- The Tank Plinth kit is used to elevate the tank to increase the head/pressure in a gravity flow system.
- Ladders are recommended to help workers to get in and out during the assembly process and for cleaning/maintenance.
- Where the tank is installed on a concrete slab base the Anchor Bolt kit is required.

Ready To Ship: 2 days

Made In: United Kingdom

Packaging: Wooden crate & pallet

Item Dimensions (cm): See individual kits

Volume (m³): 2.45

Weight (kg): 760
